Telesto Broadcast Solutions completes Major Studio Project for Virgin

2006 saw Telesto Broadcast Solutions consolidate its reputation as the premier company in Asia providing consultancy and integrations services to the radio broadcast industry.

The design met the client's needs exactly with the broadcast centre comprising two floors with 2000m² shared between offices and studios. The facility has been designed for 22 studios, of which 8 are dedicated self-operated format on air studios and the remainder are used for production, news contribution, voice tracking and dubbing. There is enough capacity for 16 transmission paths and associated incoming and outgoing outside broadcast lines.

The flexible technical design was implemented by Telesto using Klotz Digital DCII audio mixers and the Klotz Digital Vadis integrated routing and control system which enables each studio to be customised to the current operational needs. The fault tolerant design uses five Vadis main frames for audio routing, talkback and control assignment to ensure total flexibility and is fully upgradeable.

Lindsay Muggridge, Chief Engineer commented, "Virgin Radio Thailand invested a great deal of capital in this venture and the completed studios far exceeded our expectations. This is mainly due to the professionalism of Telesto Broadcast Solutions who installed and designed the electronic component. With Telesto's input, Virgin now has "state-of-the-art" world class digital studios. To say that it is the best broadcasting complex in Asia, would be an understatement."
